

News release

Sofyne Active Technology renews and extends their ISO 27001 certifications, affirming its commitment to data confidentiality and security.

On October 18th, 2023, Sofyne Active Technology successfully renewed and extended their ISO 27001 certification. Covering a wide range of its activities, this certification is a key step in Sofyne Active Technology's commitment to guarantee its customers a high level of confidentiality and security for their data.

Certification to protect our company, our employees and our customers

ISO 27001 is the international reference standard for the implementation of an Information Security Management System (ISMS) and certifies the existence of procedures, processes, and management systems for identifying cyber threats, controlling the associated risks and implementing appropriate protection measures to ensure the confidentiality, availability and integrity of information.

This international certification attests to the good practices and procedures implemented by Sofyne Active Technology in the areas of internal information systems security and the protection of its customers' information and data.

It ensures that risks are regularly reassessed, with the aim of continuously improving security.

The security and integrity of its customers' data has always been at the core of Sofyne Active Technology's strategy. Beyond the high rate of customer loyalty, Sofyne Active Technology wanted to provide them with guarantees through this certification process.

This initiative is part of Sofyne Active Technology's objective to offer its customers and future customers an additional proof of trust, durability, and best practices.

For Cyril Marnat, Senior Data Manager at Sofyne:

*" Basically, the ISO 27001 standard sets out the framework for Information Security Management System within the company.
It challenges us to protect the human, technical and information resources needed to produce the services our customers expect. "*

A daily commitment to earn digital trust

As a leading provider of services to the digital industry, we take seriously our responsibility to create an environment of trust throughout our ecosystem.

We are committed to protecting all the data entrusted to us, as well as defending our business against cyber-attacks.

For Cyril Marnat, Senior Data Manager at Sofyne:

"Information Systems Security is a strategic issue at the heart of Sofyne Active Technology's concerns. ISO-27001 certification is therefore a crucial step in our continued development. By integrating the requirements of this standard daily into all our digital services activities, Sofyne Active Technology is meeting the expectations of its customers, by assuring them that we have defined and implemented information security processes in line with current best practice. These cover people, processes and technology to protect their internal and confidential data, intellectual property and customer information."

About Sofyne Active Technology :

SOFYNE Active Technology is a leading IT services company specialized in MES/MOM (Manufacturing Execution System/Operations Management) and PLM (Product Lifecycle Management) domains.

We have 200 consultants across 5 Countries (France, United Kingdom, Swiss, Poland & Portugal), ensuring our customers can tap into the power of the Industrial Internet and the Industry 4.0 disruptive concept.

The acceleration of product customization, regulatory constraints, cybersecurity, etc., are currently putting more pressure on industrial processes.

The principles of Industry 4.0, or digitalization of the industrial process, provide proactive solutions to overcome these disruptions. SOFYNE Active Technology is present to help our clients evaluate, administer, and maintain these new solutions by implementing MES/LES systems, which allow for strategies to surpass any new challenges. Our mission to our clients is to improve the effectiveness of the management of production activity, optimize quality, control logistic chains and production methods.

Our teams have accrued experience from a myriad of projects since 2005. This acquired knowledge is what enables us to best understand how these evolutions impact your information systems.
